

AI DISCLOSURE — Agentic Code Intelligence

AI-assisted development tools were used during the development of this project for coding assistance, debugging, documentation, troubleshooting, and development support.

The final system architecture, retrieval pipeline, preprocessing approach, retrieval implementation, evaluation methodology, and submitted results were implemented and verified by the project team.

The system itself is a retrieval and ranking system. It uses Dense Retrieval, BM25 lexical retrieval, AST/structural retrieval, Reciprocal Rank Fusion (RRF), and Cross-Encoder reranking.

No Large Language Model (LLM) is used to generate answers or code as part of the submitted retrieval pipeline.

The official MTEB AppsRetrieval evaluation was conducted on the submitted system, and the reported results are based on the actual evaluation output.
